

2. Hash Table Analysis

part a

we start with an empty hash table of size 7,

Hash function $h(k) = k \% m$

0	1	2	3	4	5	6

(1) Insert 15

$$h(15) = 15 \% 7 = 1$$

\Rightarrow 15 goes into index 1

	15					
0	1	2	3	4	5	6

(2) Insert 22

$$h(22) = 22 \% 7 = 1$$

index 1 is already occupied by 15

$$h(22, 1) = (1 + 1^2) \% 7 = 2$$

\Rightarrow 22 goes into index 2

	15	22				
0	1	2	3	4	5	6

(3) Insert 36

$$h(36) = 36 \% 7 = 1$$

index 1 occupied by 15 and index 2 occupied by 22

$$h(36, 2) = (1 + 2^2) \% 7 = 5$$

\Rightarrow 36 goes into index 5

	15	22			36	
0	1	2	3	4	5	6

(4) Remove 22

$$h(22) = 22 \% 7 = 1$$

22 is not at index 1 $\Rightarrow h(22, 1) = (1 + 1^2) \% 7 = 2$

found 22 at index 2 \Rightarrow delete

	15	R			36	
0	1	2	3	4	5	6

(5) Find 36

$$h(36) = 36 \% 7 = 1$$

36 is not at index 1 $\rightarrow h(36, 1) = (1+1^2) \% 7 = 2$

36 is not at index 2 $\rightarrow h(36, 2) = (1+2^2) \% 7 = 5$

\Rightarrow found 36 at index 5, return.

	15	R			36	
0	1	2	3	4	5	6

(6) Insert 10

$$h(10) = 10 \% 7 = 3$$

\Rightarrow inserting 10 at index 3 causes the load factor to exceed $1/2$

$= 4/7 > 1/2$. Therefore, we must resize the table to 11.

	15	R	10		36	
0	1	2	3	4	5	6

Before

	15	R	10		36					
0	1	2	3	4	5	6	7	8	9	10

After

Part b

$$h_2(k) = 3 - (k \% 3)$$

(1) Insert 15

$$h(15) = 15 \% 7 = 1$$

\Rightarrow Insert 15 at 1

	15					
0	1	2	3	4	5	6

(2) Insert 22

$$h(22) = 22 \% 7 = 1$$

\Rightarrow index 1 is occupied $\rightarrow 1 + h_2(22) = 1 + (3 - (22 \% 3))$
 $= 1 + 2 = 3$

\Rightarrow Insert 22 at index 3

	15		22			
0	1	2	3	4	5	6

(3) Insert 36

$$36 \% 7 = 1$$

$$1 \text{ is already occupied} \Rightarrow 1 + (3 - (36 \% 7)) = 4$$

\Rightarrow insert 36 at index 4

	15		22	36		
0	1	2	3	4	5	6

(4) Remove 22

$$22 \% 7 = 1 \Rightarrow 22 \text{ is not at index 1}$$

$$1 + (3 - (22 \% 7)) = 3$$

Found 22 at index 3, delete

	15		R	36		
0	1	2	3	4	5	6

(5) Find 36

$$h(36) = 36 \% 7 = 1 \Rightarrow 36 \text{ is not at index 1}$$

$$\Rightarrow 1 + (3 - (36 \% 7)) = 4$$

Found 36 at index 4, return

	15		R	36		
0	1	2	3	4	5	6

(6) Insert 10

$$h(10) = 10 \% 7 = 3$$

insert 10 at index 3 since it is 'R'

	15		10	36		
0	1	2	3	4	5	6

part C

Given that there are 3 hash functions, m indices, and $\frac{2m}{3}$ indices are true ($\frac{m}{3}$ are false). In order to get a false positive, all three hash functions must return true, and the probability of the event is $(\frac{2}{3})^2 = \frac{4}{9}$. Therefore on average, we will get $2 \times \frac{4}{9} = \frac{8}{9}$ false positives

(8)

3. Cache Analysis

(1)

For the large test, I used the entire text of Hamlet.
For the first moderate-sized test on uniformly random data,
I used `std::rand()` function to generate random numbers from 1 to 100.
For the second moderate-sized test on English text ~~set~~,
I used the inaugural speech from president John F. Kennedy

(2)

Hamlet: 5000

Random Numbers: 100

JFK Speech: 100

(3)

Hamlet: 107299

Random Numbers: 7393

JFK Speech: 2613

(4)

Hamlet: ~32000

Random Numbers: ~~1000~~ 1000

JFK Speech: 1366

(5)

Hamlet: 3.35

Random Numbers: 3.39

JFK Speech: 1.91

(6)

Hamlet: 26933

Random Numbers: 900

3FK: 1241

(7) Even though the two moderate-sized tests have similar size, the random numbers had far-less cache miss than the speech. I believe this happened due to the fact that the numbers were 'uniformly-random' whereas the words in speech was not random. Also, the random number test always had more rotations despite changing the capacity.

(8) I recorded each of Right Rotate calls and Left Rotate calls and found out that for all test cases, there are always far-more right rotations than left rotations, sometimes doubling.
